  - A\* in ERA Journal List. Times Cited: 151.
  - The paper was reported in “China air quality study has good news and bad news”, *The New York Times*, Mar 30, 2016: *The team scrutinized three years of air quality data for the measure known as PM2.5, the fine particulate matter that is especially hazardous to health. One source of the data was the Chinese Ministry of Environmental Protection. The other was the United States Embassy in Beijing and consulates in Guangzhou, Shanghai, Chengdu and Shenyang. By using two independent data sets, the researchers answered a second question: Is the Chinese government’s air quality data trustworthy? The answer: Yes, at least in these five cities. That was one piece of good news.*

  - A\* in ERA Journal List. Times Cited: 346.
  - The paper was reported in “Hundreds of Chinese cities don’t meet air standards, report finds”, *The New York Times*, Apr 21, 2015: *The government’s air-monitoring methodology was recently called into question in a report released by the Center for Statistical Science at Peking University. That report said the air monitors and the collection of data by the government failed to take into account wind patterns and other weather phenomena when calculating PM2.5 levels.*

*Windy months might give a false impression that PM2.5 levels have dropped. The report said that average PM 2.5 levels in 2013 and 2014 were worse than in the two previous years if weather patterns were taken into account.*
